- Assignment 2 due Saturday 23:59 (final question removed, deferred to A3)
- Midterm 1 on Tuesday (bring your student ID and writing implements)

Last time

We explored periodic DT complex exponential signals:

$$x[n] = e^{j\omega n} = e^{j \cdot \frac{2\pi}{N} n}$$

↪ fundamental period

We found that these signals behave differently than CT signals...

Difference 1: we only need to consider ω in the range $[0, 2\pi)$.

$$\begin{aligned} x[n] &= e^{j(\omega + 2\pi)n} \\ &= e^{j\omega n} \cdot \underbrace{e^{j2\pi n}}_1 \\ &= e^{j\omega n} \end{aligned}$$

Difference 2: there are additional criteria for periodicity.

$$\begin{aligned}
 x[n+N] &= e^{j\omega(n+N)} \\
 &= e^{j\omega n} \cdot \underbrace{e^{j\omega N}}_1
 \end{aligned}
 \qquad
 \begin{aligned}
 \omega N &= 2\pi \cdot m \\
 &\quad \downarrow \\
 &\quad m \text{ is integer}
 \end{aligned}$$

Example: $x[n] = \sin(5\pi n/7)$ is periodic.

- In CT, period of $x(t) = \sin(5\pi t/7)$ is $T = \frac{2\pi}{\omega} = \frac{14}{5}$
- In DT, period of $x[n] = \sin(5\pi n/7)$ is $N=14$

Example: $x[n] = \sin(5n/7)$ is NOT periodic in DT.

$$\frac{5\pi n}{7} = 2\pi \cdot m$$

$$\sum_{k=-\infty}^{\infty} e^{j\omega_k t}$$

Difference 3: there are only finitely many harmonics.

$$x_0[n] = 1$$

$$x_1[n] = e^{j \cdot \frac{2\pi}{N} n}$$

$$x_2[n] = e^{j \cdot 2 \cdot \frac{2\pi}{N} n}$$

$$\vdots$$

$$x_{N-1}[n] = e^{j(N-1) \cdot \frac{2\pi}{N} n}$$

$$x_N[n] = e^{jN \frac{2\pi}{N} n} = e^{j \cdot 2\pi n} = 1$$

$$\vdots$$

$$\Rightarrow x_k[n] = e^{j \frac{2\pi}{N} k n}$$

Last time

We found DT complex exponential signals are also eigenfunctions of LTI systems.

$$\begin{aligned}x(t) &= e^{j\omega t} \rightarrow y(t) = H(j\omega) \cdot e^{j\omega t} \\y[n] &= \sum_{k=-\infty}^{\infty} x[n-k] h[k] & x[n] &= e^{jm\omega n} \\&= \sum_{k=-\infty}^{\infty} e^{jm\omega(n-k)} h[k] \\&= e^{jm\omega n} \sum_{k=-\infty}^{\infty} e^{-jkm\omega} h[k] \\&= x[n] \cdot H(e^{j\omega})\end{aligned}$$

We need a Fourier series representation of DT signals:

$$x[n] = \sum_{k=0}^{N-1} c_k e^{jk\omega n}$$

Learning outcomes:

- Evaluate Fourier series coefficients of DT signals
- Define filter systems through the frequency response
- ~~Distinguish between finite impulse response and infinite impulse response filters in DT~~

DT Fourier coefficients

$$x[n] = \sum_{k=0}^{N-1} c_k e^{jk\omega n}$$

$$x(t) = \sum_{k=-\infty}^{\infty} c_k e^{jk\omega t}$$

$$1 + e^{j\frac{2\pi}{5}n} + e^{j2 \cdot \frac{2\pi}{5}n} + \dots$$

Leverage the following identity about complex numbers:

$$\sum_{n=0}^{N-1} e^{jk\frac{2\pi}{N}n} = \begin{cases} N & \text{if } k=0, \pm N, \pm 2N, \dots \\ 0 & \text{otherwise} \end{cases}$$

We will multiply on both sides, and sum.

$$N=2: \quad e^{j\pi \cdot 0} = 1 \quad e^{j\pi \cdot 1} = -1 \quad e^{j\frac{2\pi}{N}k}$$

$$N=3: \quad e^{j\frac{2\pi}{3} \cdot 0} \quad e^{j\frac{2\pi}{3} \cdot 1} \quad e^{j\frac{4\pi}{3} \cdot 1} \quad e^{j\frac{2\pi}{N}k}$$

DT Fourier coefficients

$$x[n] = \sum_{k=0}^{N-1} C_k e^{jk \cdot \frac{2\pi}{N} n}$$

$$x[n] = \sum_{k=0}^{N-1} C_k e^{-jm \frac{2\pi}{N} n} e^{jk \frac{2\pi}{N} n}$$

$$x[n] = \sum_{n=0}^{N-1} \sum_{k=0}^{N-1} C_k e^{-jm \frac{2\pi}{N} n} e^{jk \frac{2\pi}{N} n}$$

$$= \sum_{n=0}^{N-1} \sum_{k=0}^{N-1} C_k e^{jn \frac{2\pi}{N} (k-m)}$$

$$= C_m \cdot N$$

$$C_m = \frac{1}{N} \sum_{n=0}^{N-1} x[n] e^{-jm \frac{2\pi}{N} n}$$

$$x(t) = \sum C_k e^{jk\omega t}$$

$$C_k = \frac{1}{T} \int_T x(t) e^{-jk\omega t} dt$$

DT Fourier coefficients

DT Fourier synthesis equation

$$x[n] = \sum_{k=0}^{N-1} c_k e^{jk \frac{2\pi}{N}}$$

DT Fourier analysis equation

$$c_k = \frac{1}{N} \sum_{n=0}^{N-1} x[n] e^{-jk \frac{2\pi}{N}} = \frac{1}{N} \sum_{n=\langle N \rangle} x[n] e^{-jk \frac{2\pi}{N}}$$

$N=5$

$$\begin{array}{cccccccccccc}
 c_{-3} & c_{-2} & c_{-1} & c_0 & c_1 & c_2 & c_3 & c_4 & c_5 & c_6 & c_7 & \dots \\
 & c_2^* & c_1^* & c_0 & c_1 & c_2 & c_3 & c_4 & c_5 & c_6 & c_7 & \dots \\
 & & & & & & c_2^* & c_1^* & & & &
 \end{array}$$

Exercise: the DT square wave

Compute the Fourier coefficients of this signal:

$$C_k = \frac{1}{6} \sum_{n=0}^5 x[n] e^{-jk\frac{2\pi}{6}n} = \frac{1}{6} \sum_{n=0}^5 x[n] e^{-jk\frac{\pi}{3}n}$$

$N=6$

Exercise: the DT square wave

$$C_k = \frac{1}{6} \sum_{n=0}^5 x[n] e^{-j \frac{k\pi n}{3}}$$

$$C_0 = \frac{1}{6} \sum_{n=0}^5 x[n] = \frac{1}{6} [1+1+1+0+0+0] = \frac{1}{2}$$

$$C_1 = \frac{1}{6} \sum_{n=0}^5 x[n] e^{j \frac{\pi n}{3}} = \frac{1}{6} [1 + e^{j \frac{\pi}{3}} + e^{j \frac{2\pi}{3}}] = \frac{1}{6} [1 - \sqrt{3}j] \Rightarrow C_5$$

$$C_2 = \frac{1}{6} \sum_{n=0}^5 x[n] e^{j \frac{2\pi n}{3}} = \frac{1}{6} [1 + e^{j \frac{2\pi}{3}} + e^{j \frac{4\pi}{3}}] = 0$$

$$C_3 = \frac{1}{6} \sum_{n=0}^5 x[n] e^{j \pi n} = \frac{1}{6} [1 + e^{j \pi} + e^{j 2\pi}] = \frac{1}{6}$$

$$C_4 = 0$$

$$C_0 \quad C_1 \quad C_2 \quad C_3 \quad C_2^* \quad C_1^*$$

$$C_5 = \frac{1}{6} [1 + \sqrt{3}j] = C_1^*$$

Properties of DT Fourier coefficients

TABLE 3.2 PROPERTIES OF DISCRETE-TIME FOURIER SERIES

Property	Periodic Signal	Fourier Series Coefficients
	$x[n]$ } Periodic with period N and $y[n]$ } fundamental frequency $\omega_0 = 2\pi/N$	a_k } Periodic with b_k } period N
Linearity	$Ax[n] + By[n]$	$Aa_k + Bb_k$
Time Shifting	$x[n - n_0]$	$a_k e^{-jk(2\pi/N)n_0}$
Frequency Shifting	$e^{jM(2\pi/N)n} x[n]$	a_{k-M}
Conjugation	$x^*[n]$	a_{-k}^*
Time Reversal	$x[-n]$	a_{-k}
Time Scaling	$x_{(m)}[n] = \begin{cases} x[n/m], & \text{if } n \text{ is a multiple of } m \\ 0, & \text{if } n \text{ is not a multiple of } m \end{cases}$ (periodic with period mN)	$\frac{1}{m} a_k$ (viewed as periodic with period mN)
Periodic Convolution	$\sum_{r=(N)} x[r]y[n-r]$	$Na_k b_k$
Multiplication	$x[n]y[n]$	$\sum_{l=(N)} a_l b_{k-l}$
First Difference	$x[n] - x[n-1]$	$(1 - e^{-jk(2\pi/N)})a_k$
Running Sum	$\sum_{k=-\infty}^n x[k]$ (finite valued and periodic only) (if $a_0 = 0$)	$\left(\frac{1}{1 - e^{-jk(2\pi/N)}} \right) a_k$
Conjugate Symmetry for Real Signals	$x[n]$ real	$\begin{cases} a_k = a_{-k}^* \\ \Re\{a_k\} = \Re\{a_{-k}\} \\ \Im\{a_k\} = -\Im\{a_{-k}\} \\ a_k = a_{-k} \\ \angle a_k = -\angle a_{-k} \end{cases}$
Real and Even Signals	$x[n]$ real and even	a_k real and even
Real and Odd Signals	$x[n]$ real and odd	a_k purely imaginary and odd
Even-Odd Decomposition of Real Signals	$\begin{cases} x_e[n] = \mathcal{E}\{x[n]\} & [x[n] \text{ real}] \\ x_o[n] = \mathcal{O}\{x[n]\} & [x[n] \text{ real}] \end{cases}$	$\begin{cases} \Re\{a_k\} \\ j\Im\{a_k\} \end{cases}$

Exercise: the DT square wave

Let's try the same thing as we did in CT:

- shift the signal left by 1
- speed it up by 2

try it yourself!

Where do we go from here?

We've showed a couple important things so far.

Signals can be expressed in terms of weighted, shifted impulses.

$$x(t) = \int_{-\infty}^{\infty} x(\tau) \delta(t-\tau) d\tau \quad x[n] = \sum_{k=-\infty}^{\infty} x[k] \delta[n-k]$$

Where do we go from here?

If we know what an LTI system does to a unit impulse (the impulse response $h(t)$ or $h[n]$), we can learn what it does to any signal.

This was the convolution integral and sum:

$$y(t) = \int_{-\infty}^{\infty} x(\tau) h(t-\tau) d\tau$$
$$y[n] = \sum_{k=-\infty}^{\infty} x[k] h[n-k]$$

Where do we go from here?

Complex exponential signals are eigenfunctions of LTI systems:

$$x(t) = e^{j\omega t} \rightarrow y(t) = H(j\omega) e^{j\omega t} \quad H(j\omega) = \int_{-\infty}^{\infty} h(\tau) e^{-j\omega\tau} d\tau$$

$$x[n] = e^{j\omega n} \rightarrow y[n] = H(e^{j\omega}) e^{j\omega n} \quad H(e^{j\omega}) = \sum_{k=-\infty}^{\infty} h[k] e^{-j\omega k}$$

$H(j\omega)$ in CT, and $H(e^{j\omega})$ in DT, are the **frequency response** of the system (more generally, system functions).

$$x(t) = \sum_{k=-\infty}^{\infty} C_k e^{j\omega_k t} \longrightarrow y(t) = \sum_{k=-\infty}^{\infty} C_k H(j\omega_k) e^{j\omega_k t}$$

Through careful choice of $H(j\omega)$ or $H(e^{j\omega})$, we can change the behaviour of a system.

Example

What does a system with the following frequency response do?

$$H(j\omega) = \begin{cases} 1 & |\omega| \leq \omega_c \\ 0 & |\omega| > \omega_c \end{cases}$$

$$y(t) = \sum_{k=-\infty}^{\infty} C_k H(jk\omega) e^{jk\omega t}$$

Filters are LTI systems that can be used to separate out, combine, or modify the components of a signal at specific frequencies.

Two key types:

- **Frequency-shaping**: change the amplitudes of parts of a signal at specified frequencies
- **Frequency-selective**: eliminate or attenuate parts of a signal at specified frequencies

CT frequency-selective filters

We can also consider an ideal **highpass** filter:

$$H(j\omega) = \begin{cases} 1 & |\omega| > \omega_c \\ 0 & |\omega| \leq \omega_c \end{cases}$$

CT frequency-selective filters

Or an ideal **bandpass** filter:

$$H(j\omega) = \begin{cases} 1 & \omega_1 \leq |\omega| \leq \omega_2 \\ 0 & \text{otherwise} \end{cases}$$

DT filters

Recall that in DT, the frequency increases up until $\omega = \pi$, then decreases as it approaches 2π .

low pass

High pass

band pass

$$\frac{3\pi}{2}$$

$$\downarrow$$

$$-\frac{\pi}{2}$$

Today's learning outcomes were:

- Evaluate Fourier series coefficients of DT signals
- Define filter systems through the frequency response
- ~~Distinguish between finite impulse response and infinite impulse response filters in DT~~
